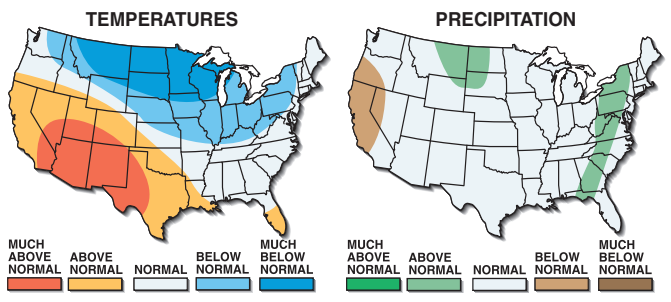
Outlook for March 30 - April 5



WEEK AHEAD FORECASTS

Illinois: Cooler across Illinois on Friday. A storm will bring some rain to Illinois Friday into Saturday, then largely dry on Sunday. Additional rainfall is possible early next week.

Indiana: Rather cool across Indiana through the weekend. Scattered showers are possible on Friday and Saturday, then briefly drying out on Sunday. Additional rainfall is expected early next week.

30-DAY OUTLOOK

Chilly across the Midwest, including Illinois and Indiana, to start April. Turning milder around mid-April, then turning cooler again late month. Overall, temperatures the next 30 days will average near to below normal. An active pattern across the Midwest will result in precipitation mostly near normal in Illinois and Indiana over the next 30 days.

SOUTH AMERICA

A stalled front will lead to scattered showers and storms from Paraguay to southern Brazil into early next week, while northern Argentina is largely dry.

Temperatures for March 30 - April 5

Temperatures in °F | Dep. = forecast temperature departure

Indiana: A series of fronts and lows will bring several bouts of mainly rain to Indiana into next week. As a result, precipitation overall will average near normal.

Illinois: A steady parade of lows and fronts will bring several rounds of mainly rain to Illinois into next week. Overall, precipitation across Illinois will average close to normal.

Dicamba's last year? Success, or failure, of herbicide is up to you

By Jean Payne

Can we keep dicamba on target in 2018? We must, or agriculture will lose this technology.

Since 2005, the universities have been trying to tell us that weed resistance is a fundamental problem. Were we listening?

Sort of – but too many have disregarded the seriousness of their message, choosing instead to believe, hope and dream that the next new herbicide was just around the corner, like it always has been since the 1940s.

Here's the reality: there are no new herbicide modes of action coming to agriculture anytime soon.

What we have in our chemical toolbox are a decent number of active ingredients that we need to protect and use carefully because if they fail, there is no replacement.

The other weed management tools, including crop rotation beyond corn and soybean, cultivation, drilling soybeans and walking fields are concepts that make us shudder.

Could it really come to that? Yes.

If we do not properly steward the herbicides that remain legal to use and do not embrace an integrated weed management system that goes beyond the use of post-emerge herbicides, then the weed seed bank in our soil grows and the weeds win.

Modern science is amazing, but Mother Nature is relentless. Mother Nature also does not have to report to the U.S. Environmental Protection Agency, to the European Union or to the public.

Payne

Dicamba is not the answer to glyphosate-resistant weeds in soybean. It is one management tool that we still have, for at least one more season. It faces near-certain cancellation from the post-emerge soybean market if it does not remain on-target in 2018.

I've been honored to work for an organization which has effectively lobbied for good pesticide policy for decades.

But no person and no organization, no matter how successful we have been, can or should defend the repeated off-target movement of a pesticide. To do so would sacrifice our integrity, lose public trust and taint the image of agriculture in a world that increasingly demands more from us, not less.

Today's reality is this: no farmer or ag retailer should be banking on a new herbicide to hit the market in the next few years, the next decade or maybe in our lifetime.

The research investments at the basic manufacturing level are impressive, but the prospects of discovering and bringing to market a new chemistry that delivers in the field and that also meets ever-more stringent toxicological, environmental and sustainability standards is a daunting task. We need to face the reality that there probably never will be another "easy button" for weed management.

Weed management probably eclipses the challenges we face in nutrient management. From a farm profitability standpoint, it is more challenging.

We've been proactive in managing nutrients to reduce loss mostly out of fear of nutrients being regulated. We should be equally concerned about what may happen to pesticide regulations if we can't keep dicamba on target in 2018.

Symptoms in soybean are bad. Symptoms in specialty crops, trees, gardens and natural areas are exponentially worse, and the combination of both is tragic.

What can an applicator do in 2018 to keep dicamba as a tool in the precious integrated weed management toolbox?

DICAMBA

FROM PAGE A6

1. Accept the fact that there are no silver bullets — dicamba is not a silver bullet.
2. Follow the University of Illinois guidance for dicamba use on soybean, available at: http://bulletin.ipm.illinois.edu/?p=4065.
3. The U of I's four-step process of starting clean, scouting, using residuals and only using dicamba in early post is not an easy approach — but there are no easy approaches if we want to keep this technology in the short and long-term. Last year was not good. We have one more year to get it right. Please review the detailed steps in Dr. Aaron Hager's Bulletin.
4. Dicamba is not a rescue treatment — if you view it as such, then your weed management system has failed.

If off-target movement happens again in 2018, picture a scenario where dicamba use on soybeans is cancelled in late 2018, followed by the real possibility that dicamba use on any crop is cancelled in subsequent years due to misuse of the product on soybeans.

That means no dicamba as a burndown or for use in corn or pastures, removing one of the few, effective weed management tools from your toolbox. And there's no replacement coming anytime soon.

This is all difficult to accept. But we must be honest with ourselves.

We know that dicamba is a product that doesn't always stay put. We know the new products went off target in 2017, even when applied by very experienced applicators.

The registrants of the products labeled for use on soybean have stated in the training sessions that even when used under all the mandatory label conditions, it is a low-volatile product; it is not a "no" volatile product. Knowing all of this, we cannot afford to repeat any of the mistakes of last year.

Success will be no symptoms and successful weed control — steps which can be achieved if we are willing to prepare, plan and take a stand against dicamba misuse. We all know that the conditions on the label will severely limit the days when you can legally apply these products.

Simply reducing the number of official complaints to the Illinois Department of Agriculture in 2018 also is not a measure of success. If symptoms occur in non-target plants and we all know it, it is failure whether the issues are reported or not.

Success will be no symptoms and successful weed control — steps which can be achieved if we are willing to prepare, plan and take a stand against dicamba misuse.

We all know that the conditions on the label will severely limit the days when you can legally apply these products. Going into this season, do you accept this?

Does your integrated weed management program take this brutal reality into consideration? If your answer is "yes," then there is a chance that we can keep this technology in the toolbox.

The safe and judicious use of pesticides in the USA hinges upon the premise, understanding and trust that the pesticide label is protective and that it will be followed by the applicator.

If we cannot do that, then everything we've based our pesticide use policies on will be revisited, reevaluated and reinvented. This will not be good for agriculture. What happens with dicamba in 2018 is pivotal.

The U of I guidelines for dicamba use in Illinois are tough medicine, but managing weeds today and in the future is akin to managing a chronic, painful disease with no new drugs. It will take tough medicine and determination to succeed.

I believe Illinois agriculture can succeed, if we all accept reality, make good decisions and promote stewardship.

Jean Payne is the president of the Illinois Fertilizer and Chemical Association.

0% FINANCING FOR 60 MONTHS

ONE MULTI-TASKER DESERVES ANOTHER.

From field to feedlot, you need a tractor that can multi-task as well as you do. Case IH Farmall™ 100A series tractors are tough, reliable, remarkably versatile and an excellent value. The transmission, engine and hydraulic systems work seamlessly to make complex chores easier and faster than ever. The simple-to-use controls allow you to get in and go, and the comfortable operator environment makes a long day seem short. With four models available in cab or non-cab versions and two-wheel drive or optional mechanical front-wheel drive configurations, you're sure to find one that's right for your operation and budget.
